Source code of examples, and installation guide

The examples can be tried online at JSBin as you will discover in the following pages, but the upload is "faked". These online examples do not use a real server, but are useful for playing with the code and understanding how it works. You can try them and see uploads' progress, etc.

However, we also provide complete source code for these examples, including the server-side PHP code. The course is about HTML5, not PHP, so we provide this code "as is": it is only a few lines long per example, and has been tested with the last version of PHP. It should run out of the box with most WAMP, LAMP and MAMP distributions (Apache / PHP).

Just unzip the archive and follow the included READMEs. These examples propose **different implementations of the two approaches** presented in the previous page of this lesson, and both with an `<input type=file>` and with drag and drop.

The HTML part of the examples is also using a technique we saw during the HTML5 Part 1 course, that saves the input fields' content as you type, using LocalStorage. You can reload the page any time without loosing what you typed. Initially the examples all used a FormData object but we encountered some incompatibilities with old PHP versions, at the time these examples had been written, so we had to manually set a part of the HTTP header.

This part of the lesson is optional and is mainly useful for students who are also involved in the server side of the Web development. Ask in the forum if you are interested by examples that use Java instead of PHP for handling multipart forms sent using Ajax.

DOWNLOAD ALL EXAMPLES (AUTHORS: MICHEL BUFFA, IMPROVEMENTS AND FIXES BY VINCENT MAZENOD)

- Zip file containing all examples (html + css + js + php + readmes)
